# ACUTE CORONARY SYNDROMES

Non-ST elevation ACS

ST elevation ACS

## H&P

### • History

- Cardinal sx of angina
  1. Substernal chest discomfort w/ characteristic quality (pressure) & duration (minutes)
  2. Provoked by physical exertion or emotional stress
  3. Relieved by rest or NTG
- Typical angina: All 3 features
- Atypical angina: 2 of 3 features
- Noncardiac chest pain: 0 or 1 feature

### • Physical exam

- Pain not reproducible
- Signs of vascular disease
- Signs of HF

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## ECG

- **What to look for**
  - STE or LBBB not known to be old
  - ST depression  $\geq 0.5$  mm; TWI  $> 1$  mm
  - Coronary distribution
- **What else to look for**
  - Q waves or poor R-wave progression (PRWP)
- **How to look for it**
  - 12-lead ECG w/in 10 mins of presentation
  - Compare to prior ECGs
  - Obtain serial ECGs (initial  $\oplus$  in  $< 50\%$  ACS Pts)

## Where is the Lesion?

## Where is the Lesion?

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## ECG Special Placement

Right-sided leads ( $V_{4R}$ ) Posterior leads ( $V_7-V_9$ )

*To diagnose RV infarct in setting of  
inferior STEMI (due to prox RCA  
occlusion)*

*To diagnose posterior MI (due to  
LCx occlusion) in setting of  
concerning sx and either ant. ST  
depressions or normal ECG*

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Ruling In & Ruling Out MI

---

### Case #1

75 yo M p/w chest pain x 15 minutes that occurred 4 hours ago.  
ECG without abnormalities.

Your high-sensitivity troponin testing strategy is:

- A. Check now; if undetectable, discharge to home
- B. Check now and in 1 hour; if both <99<sup>th</sup> %ile and no change over time, discharge to home
- C. Check now and 3-6 hours after sx onset; if both <99<sup>th</sup> %ile, discharge to home

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Ruling In & Ruling Out MI

---

### Case #1

75 yo M p/w chest pain x 15 minutes that occurred 4 hours ago.  
ECG without abnormalities.

Your high-sensitivity troponin testing strategy is:

- A. Check now; if undetectable, discharge to home
- B. Check now and in 1 hour; if both <99<sup>th</sup> %ile and no change over time, discharge to home**
- C. Check now and 3-6 hours after sx onset; if both <99<sup>th</sup> %ile, discharge to home

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

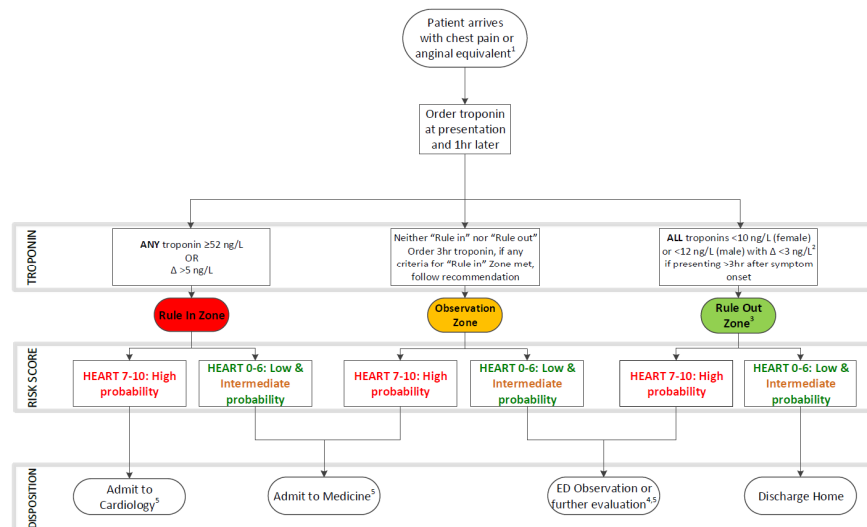

## ACS: Biomarkers

Era	Assay	Measure at presentation + ...
Ancient History (1980s)	CK-MB	q8 hrs × 3
Dawn of modern cardiac markers (1990s)	<b>Troponin</b>	q8 hrs × 3
Recent past	Troponin	<b>3-6 hrs after sx onset</b>
Now	<b>hs-Troponin</b>	<b>± 1-3 hrs later</b> (depending on time from sx onset to presentation) <b>Examine absolute and <math>\Delta</math></b>

 An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## MGB Pathway

 An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## 4<sup>th</sup> Universal Definition of MI

Definition	Criteria
Myocardial <b><u>Injury</u></b>	Tn >99 <sup>th</sup> %ile (acute if rise and/or fall)
Acute Myocardial <b><u>Infarction</u></b>	Acute myocardial injury + clinical evidence of acute myocardial ischemia (eg, sx, ECG, imaging)
Type 1	<b><u>Atherothrombosis</u></b> (plaque rupture or erosion)
Type 2	Imbalance between myocardial O <sub>2</sub> supply & demand <b><u>unrelated</u></b> to acute atherothrombosis
Type 3	<b><u>Cardiac death</u></b> w/ sx + ECG Δs before Tn available
Type 4	<b><u>PCI-related</u></b> (clinical + Tn >5× 99 <sup>th</sup> %ile)
Type 5	<b><u>CABG-related</u></b> (clinical + Tn >10× 99 <sup>th</sup> %ile)

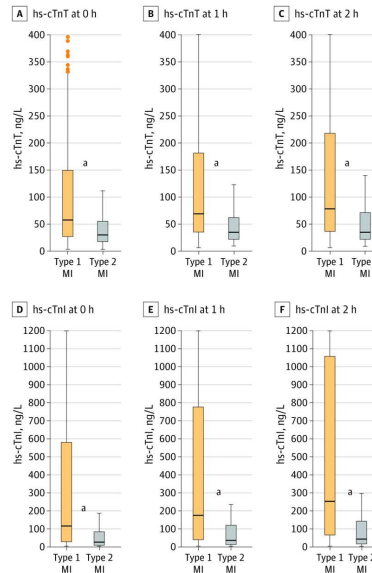

## Type 2 MI & Myocardial Injury

- **Type 2 MI = MI not due to ACS**
  - ↓ myocardial perfusion
    - Coronary artery spasm, embolism, dissection
    - HoTN, profound sustained bradycardia, severe anemia
  - ↑ myocardial demand
    - Profound sustained tachycardia; HTN
- **Myocardial Injury = ↑ Tn w/o clinical s/s ischemia**
  - Heart failure, myocarditis, CMP, Takotsubo
  - Cardiac ablation, defibrillation, cardiac contusion
  - PE, PHT
  - Stroke, SAH, critical illness

## Type 1 vs. 2 MI

- Largely a clinical diagnosis ...

JAMA Cardiol. Published online April 21, 2021

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Acute Chest Pain

## Anti-Ischemic Therapy

- **Nitrates**
  - Sx relief; no mort benefit (GISSI-3 & ISIS-4)
- **Beta-blockers**
  - ↓ ischemia, ↓ D/MI (in AMI trials)
  - PO (not IV) and only if not in HF or at risk for shock
- **Calcium channel blockers**
  - If ischemia despite max βB or βB contra.
- **Morphine**
  - Pain, CHF, agitation; *don't* mask angina
- **Oxygen**

## Which NSTEMI Go to the Cath Lab?

### Case #2

72 yo F p/w chest pain that started 3 hours ago.

ECG shows inferior ST segment depressions. Troponin elevated.

Now chest pain free and ECG normalized.

- A. Stress test now
- B. Stress test in 48 hours
- C. Cath immediately
- D. Cath within 24 hours
- E. Cath within 72 hours

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Which NSTEMI Go to the Cath Lab?

### Case #2

72 yo F p/w chest pain that started 3 hours ago.

ECG shows inferior ST segment depressions. Troponin elevated.

Now chest pain free and ECG normalized.

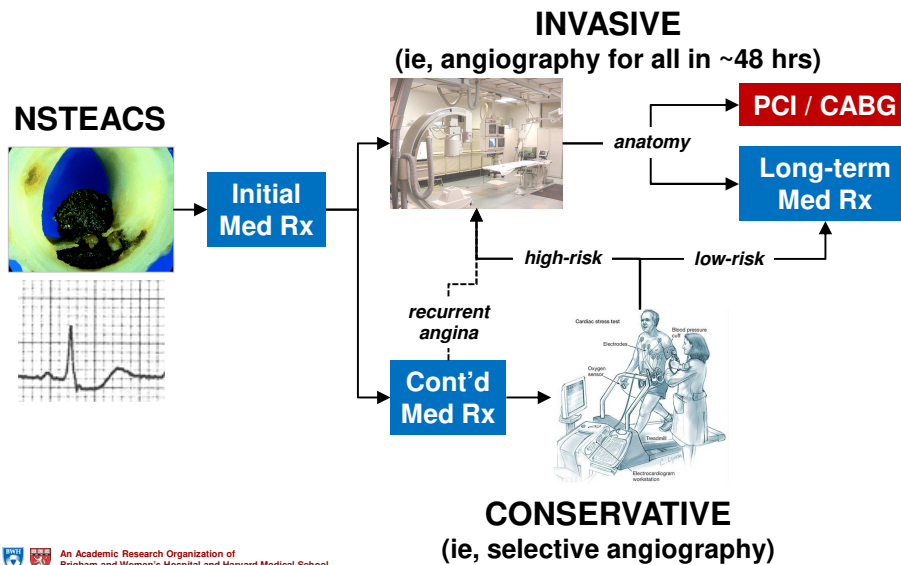

- A. Stress test now
- B. Stress test in 48 hours
- C. Cath immediately
- D. Cath within 24 hours**
- E. Cath within 72 hours

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Management Strategy in NSTEMACS

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Benefit of INV vs CONS Strategy

**INV Strategy reduces cardiac complications by ~20%,  
particularly recurrent ACS**

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

O'Donoghue M, et al. JAMA 2008;300:71-80

## Troponin Treatment Interaction

Mehta SR et al. *NEJM* 2009;360:2165-75

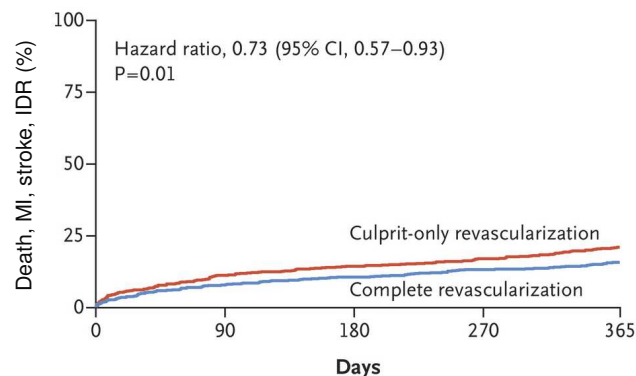

## 2014 ACC/AHA NSTEMI Guidelines: Early Invasive

Immediate (w/in 2 h)	Early Invasive (w/in 24 h)	Delayed Invasive (w/in 25-72 h)	Ischemia-Guided
<ul style="list-style-type: none"><li>• Refractory angina</li><li>• Signs or symptoms of HF or new or worsening MR</li><li>• Recurrent angina or ischemia at rest or with low-level activity despite intensive med Rx</li></ul>	<ul style="list-style-type: none"><li>• GRACE score &gt;140</li><li>• Temporal <math>\Delta</math> in Tn</li><li>• New or presumably new ST depression</li></ul>	<ul style="list-style-type: none"><li>• TIMI Risk Score <math>\geq 2</math></li><li>• GRACE score &gt;109-140</li><li>• Diabetes</li><li>• GFR &lt;60 mL/min/1.73m<sup>2</sup></li><li>• EF &lt;0.40</li><li>• Early postinfarction angina</li><li>• PCI w/in 6 mo</li><li>• Prior CABG</li></ul>	<ul style="list-style-type: none"><li>• TIMI Risk Score 0-1</li><li>• GRACE score &lt;109</li><li>• Low-risk Tn-neg female patient</li><li>• Patient or clinician preference in absence of high-risk features</li></ul>

## Complete Revasc in All MI

**FIRE: 1445 Older Pts w/ MI (65% NSTEMI) + MVD**  
*Physiology-guided complete revasc vs. culprit-only*

## Complete Revasc in All MI

**FIRE: 1445 Older Pts w/ MI (65% NSTEMI) + MVD**

*Physiology-guided complete revasc vs. culprit-only*

End Point	Complete	Culprit-Only	HR (95% CI)
Primary EP	15.7	21.0	0.73 (0.57-0.93)
Death	9.2	12.8	0.70 (0.51-0.96)
MI	4.4	7.0	0.62 (0.40-0.97)
Stroke	1.7	1.0	1.73 (0.68-4.40)
IDR	4.3	6.8	0.63 (0.40-0.98)

IDR, ischemia-driven revascularization

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

Biscaglia et al. *NEJM* 2023;389:889-98

## Noninvasive Testing Options

- **Pt needs to be free of ischemia for 12-24 hours**
- **Testing options**
  - If can exercise & interpretable ECG: exercise ECG stress test
  - Vasodilator if cannot exercise
  - Imaging if ECG uninterpretable or cannot exercise [also reasonable in all given intermediate-to-high risk of CAD]
  - Coronary CT angiography

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Antiplatelet Therapy

### Case #3

65 yo M p/w chest pain that started 2 hours ago.

ECG shows anterior ST segment depressions. Troponin elevated.

Receives aspirin. Goes to the cath lab and is found to have a 90% ulcerated LAD lesion.

What antiplatelet drug would you add?

- A. Clopidogrel
- B. Prasugrel
- C. Ticagrelor
- D. Cangrelor
- E. Eptifibatide

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Antiplatelet Therapy

### Case #3

65 yo M p/w chest pain that started 2 hours ago.

ECG shows anterior ST segment depressions. Troponin elevated.

Receives aspirin. Goes to the cath lab and is found to have a 90% ulcerated LAD lesion.

What antiplatelet drug would you add?

- A. Clopidogrel
- B. Prasugrel
- C. Ticagrelor
- D. Cangrelor
- E. Eptifibatide

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Antiplatelet Therapy Acutely

- **Start with** COX Inhibitor (ie, **aspirin**)
- **Almost always add:** P2Y<sub>12</sub> Inhibitor
  - Ticagrelor or prasugrel preferred over clopidogrel
  - Typically give oral P2Y<sub>12</sub> **at time of PCI**
  - Cangrelor if worried about oral absorption
- **Sometimes also add (typically in cath lab):** glycoprotein IIb/IIIa inhibitors (eg, abciximab, eptifibatide, tirofiban)

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Anticoagulants in NSTEMACS

- **INVASIVE STRATEGY**
  - **UFH**
  - Bivalirudin
  - Enoxaparin (LMWH)
  - *Discontinue after uncomplicated PCI*
- **CONSERVATIVE STRATEGY**
  - UFH (*Rx for 48 hrs*)
  - Enoxaparin (LMWH) (*Rx until end of hosp, up to 8 days*)

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## ST-Elevation MI (STEMI)

- **Consider immediate reperfusion therapy**
- **In whom?**
  - Within 12 hrs of sx onset, or
  - 12-24 hrs after sx onset if clinical or ECG evidence of ongoing ischemia
- **How?**
  - **Primary PCI** (including transfer to PCI-capable hosp if door-in to door-out time will be <30 min & 1<sup>st</sup> med contact to PCI anticipated <120 min)
  - Fibrinolytic (barring contraindications\*)

\***Absolute:** prior ICH; intracranial neoplasm, aneurysm, or AVM; stroke or head trauma w/in 3 mos; active internal bleeding or diathesis; suspected AoD

\***Relative:** severe HTN; stroke; prolonged CPR; recent bleed, surgery or trauma; noncompressible vasc puncture; pregnancy; current use of anticoagulants

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Revascularization in STEMI

### Case #4

65 yo M p/w STEMI, w/ inferior ST segment elevations.

Brought for immediate coronary angiography and found to have occluded RCA, which is successfully stented and Pt doing well.

Also noted to have 80% mid LAD lesion and a 50% LCx lesion.

- A. Low level stress test before discharge
- B. Stent the LAD lesion during this hospitalization or w/in 6 wks
- C. Stent the LAD & LCx lesions now

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Revascularization in STEMI

### Case #4

65 yo M p/w STEMI, w/ inferior ST segment elevations.

Brought for immediate coronary angiography and found to have occluded RCA, which is successfully stented and Pt doing well.

Also noted to have 80% mid LAD lesion and a 50% LCx lesion.

- A. Low level stress test before discharge
- B. Stent the LAD lesion during this hospitalization or w/in 6 wks
- C. Stent the LAD & LCx lesions now

## Preventive PCI in STEMI

### COMPLETE: 2016 Pts w/ STEMI + MVD

Revasc of all signif lesions ( $\geq 70\%$  or 50-69% w/ FFR  $\leq 0.80$ ) w/in 45 days vs. culprit only

## Long-Term Antithrombotic Therapy

### Case #5

64 yo M p/w NSTEMI. History of prior MI and diabetes.

Drug-eluting stent placed in LAD.

For his long-term anti-platelet regimen, you would recommend:

- A. ASA + P2Y<sub>12</sub> inhibitor for 30 days
- B. ASA + P2Y<sub>12</sub> inhibitor for 1 year
- C. ASA + P2Y<sub>12</sub> inhibitor for as long as tolerated if high ischemic risk and low bleeding risk
- D. ASA + P2Y<sub>12</sub> inhibitor for 3 months and then P2Y<sub>12</sub> inhib. monoRx

## Long-Term Antithrombotic Therapy

### Case #5

64 yo M p/w NSTEMI. History of prior MI and diabetes.

Drug-eluting stent placed in LAD.

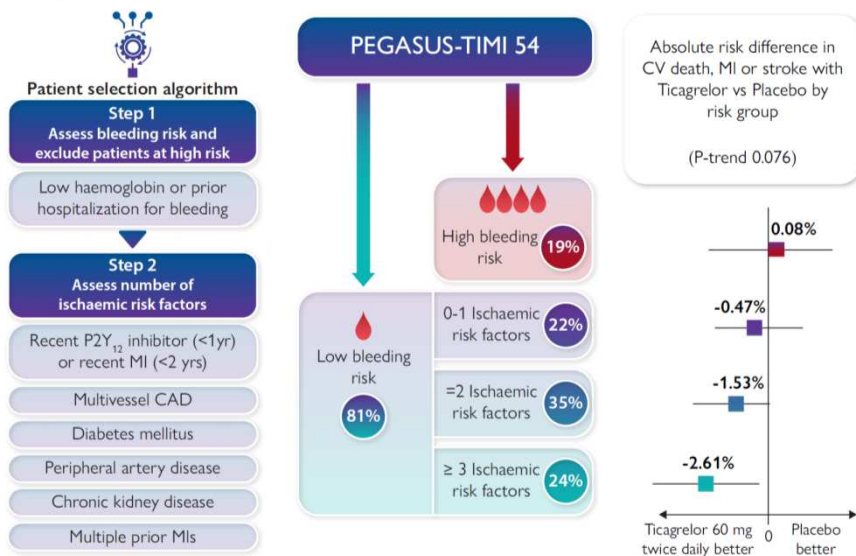

For his long-term anti-platelet regimen, you would recommend:

- A. ASA + P2Y<sub>12</sub> inhibitor for 30 days
- B. ASA + P2Y<sub>12</sub> inhibitor for 1 year
- C. ASA + P2Y<sub>12</sub> inhibitor for as long as tolerated if high ischemic risk and low bleeding risk
- D. ASA + P2Y<sub>12</sub> inhibitor for 3 months and then P2Y<sub>12</sub> inhib. monoRx

## Ticagrelor + ASA Better Than ASA Alone

## Ticagrelor + ASA Better Than ASA Alone

## Drop Aspirin after 1-3 Months (ie, P2Y<sub>12</sub> MonoRx)?

O'Donoghue ML, Murphy SA, and Sabatine MS. *Circulation* 2020; epub ahead of print

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Duration of P2Y<sub>12</sub> Inhibition?

- Start with DAPT ASA + P2Y<sub>12</sub> inhibitor (ticag or prasugrel preferred)
- For most patients: continue for 12 mos
- If high ischemic risk (and low bleeding risk & tolerated DAPT well to date), consider continuing ASA + P2Y<sub>12</sub> inhibitor beyond 12 mos
- Could consider dropping ASA after 3 mos and just continue P2Y<sub>12</sub> inhib (ideally ticagrelor)
- If high bleeding risk, would use clopidogrel over ticag or prasugrel and drop ASA after 3 mos

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Triple Therapy

---

### Case #6

72 yo F w/ HTN, DM, prior stroke p/w NSTEMI.

2 drug-eluting stents placed in proximal LAD.

On aspirin and ticagrelor.

Develops AF next day.

What should be her long-term antithrombotic regimen:

- A. Warfarin (INR 2-3), aspirin and ticagrelor
- B. Full dose NOAC, aspirin, and clopidogrel
- C. Full dose NOAC and clopidogrel
- D. Reduced dose NOAC and clopidogrel

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Triple Therapy

---

### Case #6

72 yo F w/ HTN, DM, prior stroke p/w NSTEMI.

2 drug-eluting stents placed in proximal LAD.

On aspirin and ticagrelor.

Develops AF next day.

What should be her long-term antithrombotic regimen:

- A. Warfarin (INR 2-3), aspirin and ticagrelor
- B. Full dose NOAC, aspirin, and clopidogrel
- C. Full dose NOAC and clopidogrel
- D. Reduced dose NOAC and clopidogrel

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## AUGUSTUS: Safety

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

NEJM 2019;380:1509

## AUGUSTUS: Efficacy

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

NEJM 2019;380:1509-1524

## What if the Pt needs OAC?

- High rate of bleeding with triple Rx (ASA + P2Y<sub>12</sub> + OAC)
- DOAC preferred over warfarin because less bleeding (no head-to-head, but apixaban w/ best data vs. VKA)
- Would not ↓ DOAC dose b/c may not adequately protect against stroke
- In terms of antiplt, start w/ DAPT: ASA + P2Y<sub>12</sub> inhibitor (clopidogrel to reduce bleeding risk)
- Drop ASA at hospital d/c or, if high ischemic risk, after 1 month
- Consider dropping P2Y<sub>12</sub> inhib after 6-12 mos, depending on bleeding risk

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## Lipid-Lowering Therapy

### Case #7

64 yo M w/ h/o NSTEMI 2 years ago now p/w NSTEMI.

Drug-eluting stent placed in LAD. 50% lesions in RCA and LCx.

LDL-C on admission (not on any lipid-lowering Rx) was 180 mg/dL.

Started on atorva 80 mg. What else would you recommend?

- A. Target LDL-C reduction of 50%
- B. Target LDL-C of 70 mg/dL
- C. Add ezetimibe
- D. Add PCSK9 inhibitor
- E. Add ezetimibe and/or PCSK9i to get LDL-C <70 (eg, ≤40 mg/dL)

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## PROVE IT – TIMI 22

4162 patients hospitalized w/in prior 10 d for ACS

Cannon et al. *NEJM* 2003; 350: 1495

## Primary Endpoint — ITT

Cardiovascular death, MI, documented unstable angina requiring rehospitalization, coronary revascularization ( $\geq 30$  days), or stroke

## Evolocumab (anti-PCSK9 mAb)

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

Giugliano RP et al. and Sabatine MS. *JAMA Cardiol* 2017;2:1385-91

## 2019 ESC Dyslipidemia Guidelines

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
In secondary prevention patients at very high risk <sup>c</sup> , an LDL-C reduction of at least 50% from baseline <sup>d</sup> and an LDL-C goal of < 1.4 mmol/L (< 55 mg/dL) are recommended. <sup>33-35, 119, 120</sup>	I	A

<sup>a</sup>Prior ACS, stable angina, coronary revascularization, stroke, TIA, PAD

For patients with ASCVD who experience a second vascular event within 2 years (not necessarily of the same type as the first event) while taking maximally tolerated statin-based therapy, an LDL-C goal < 1.0 mmol/L (< 40 mg/dL) may be considered.<sup>119, 120</sup>

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

## β-blockers, ACEI/ARB, MRA

- **Beta-blockers**
  - Oral BB initiated w/in 1<sup>st</sup> 24 hrs if w/o:
    - signs of HF; evidence of low-output state; ↑ risk of cardiogenic shock
    - other contraindication (PR >0.24 sec, 2/3<sup>rd</sup> heart block w/o PPM, active asthma, reactive airway disease)
  - If *stabilized* HF, metoprolol succinate, carvedilol, bisoprolol
- **ACEI (or ARB if cannot tolerate ACEI)**
  - LVEF <40%, *or*
  - HTN, diabetes, or stable CKD
- **MRA**
  - If on ACEI/ARB & BB; *and*
  - Cr ≤2-2.5, K ≤5; *and*
  - LVEF <40%, diabetes, or HF

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

Circulation 2014;130:2354-94

## Treating Inflammation

**COLCOT: 4745 Pts within 30d of acute MI**  
**Colchicine 0.5 mg qd vs. placebo**

### PROS

- Large relative risk reduction
- Benefit of similar magnitude also seen in smaller ACS trial (COPS) trial and in trial of Pts with stable ischemic heart disease (LoDoCo2)

### CONS

- Rates of non-CV death numerically higher in this trial, COPS, and LoDoCo2 (HR 1.51, 95% CI 0.99-2.31)

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School

NEJM 2019;381:2497-505

## Summary

- **Diagnose ACS** using H&P, 12-lead ECG, troponin
- **Anti-ischemic Rx:** beta-blocker, nitrates
- **For STEMI:** *select Primary PCI vs Lytic*
- **For NSTEMI/ACS:** *select Invasive vs. Conservative Strategy*
  - Tend to use INV strategy for higher risk patients (eg, Tn positive)
- **Select Antiplatelet Regimen**
  - ASA + P2Y<sub>12</sub> inhib: ticag or prasugrel (or clopidogrel); typically at time of PCI
- **Select Anticoagulant:** UFH, LMWH, bivalirudin, or fondaparinux, typically just through PCI
- **Long-term therapy**
  - ASA + P2Y<sub>12</sub> inhib (then tailor)
  - $\beta$ B, statin  $\pm$  EZE ( $\pm$  PCSK9i)
  - ? ACEI, ? Aldo inhib, ? colchicine

An Academic Research Organization of  
Brigham and Women's Hospital and Harvard Medical School
